System Overview

Framework

Functionality:

- load/save chain config
- run chain
- sanity check of chain before run

GUI

GUI Elements Functionality:

- load/save chain config
- add/rm modules
- link/unlink modules
- run chain
- sanity check of chain before run
- display logging information

Configuration Storage

- read and writeable by human and machine
- ideally simpler than XML

Modules

Modules provide the processing functionality of the framework.

Consists of

- a meta information file
- a library file

Modules

Modules provide the processing functionality of the framework.

Consists of

- a meta information file
- a library file

- void run(vector input, vector output, Context context)
 - input and output are std::vector of resources described in module meta description

- void run(vector input, vector output, Context context)
 - input and output are std::vector of resources described in module meta description
 - context implements a defined interface to the execution context
 - write to logger
 - open windows
 - 0 ...

- void run(vector input, vector output, Context context)
 - input and output are std::vector of resources described in module meta description
 - context implements a defined interface to the execution context
 - write to logger
 - open windows
 - ...

- void run(vector input, vector output, Context context)
 - Image with arbitrary number of channels
 - Grayscale, RGB, CMYK, ...
 - PolSAR
 - OpenCV Mat

- void run(vector input, vector output, Context context)
 - Image with arbitrary number of channels
 - Grayscale, RGB, CMYK, ...
 - PolSAR
 - OpenCV Mat
 - integer

- void run(vector input, vector output, Context context)
 - Image with arbitrary number of channels
 - Grayscale, RGB, CMYK, ...
 - PolSAR
 - OpenCV Mat
 - integer
 - float

- void run(vector input, vector output, Context context)
 - Image with arbitrary number of channels
 - Grayscale, RGB, CMYK, ...
 - PolSAR
 - OpenCV Mat
 - integer
 - float
 - string

- void run(vector input, vector output, Context context)
 - Image with arbitrary number of channels
 - Grayscale, RGB, CMYK, ...
 - PolSAR
 - OpenCV Mat
 - integer
 - float
 - string
 - a list of the above

- void run(vector input, vector output, Context context)
 - Image with arbitrary number of channels
 - Grayscale, RGB, CMYK, ...
 - PolSAR
 - OpenCV Mat
 - integer
 - float
 - string
 - a list of the above
 - ullet a map: string o one of the above

- void run(vector input, vector output, Context context)
 - Image with arbitrary number of channels
 - Grayscale, RGB, CMYK, ...
 - PolSAR
 - OpenCV Mat
 - integer
 - float
 - string
 - a list of the above
 - ullet a map: string o one of the above

- Organisation
- System Overview
- 3 Implementation
- 4 Time Schedule

Implementation

• Language: C++11

Build Tool: CMake

• Libraries: OpenCV, Qt

Raw Class Model

- Organisation
- System Overview
- 3 Implementation
- 4 Time Schedule

Time Schedule

Milestones

1st	26.05.2015	Core Framework Basics
		and Configuration
2nd	09.06.2015	Basic Modules
3rd	23.06.2015	GUI
4th	07.07.2015	Working framework 1.0
	14.07.2015	Final Presentation
